Melinda,

Just had a thought on the data...

Now that the water is out of the canal, the contaminated soil at the bottom will have to be excavated. I had planned to use EPA industrial levels for soil (it is an industrial not residential area), but on thought - probably couldn't make soil constituents more/less that water...since the canal goes to a recreational river - so we need to use use more stringent numbers for the soil or less stringent for the water since industrial area?

Please advise...thanks.
